     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a OSPA in the form of a vaccine. The method cospic can immunogenic fragment of particularly poikilothermic fish, against the bacterial pathogen animals, rickettsial septicaemia (SRS) and other fiskettsial gainst salmonid recember 1. Sequence represents P. salmonis OSPA protecting against salmonid N-terminal fusion partner is used in a vaccine to create an anti-OSPA anti-hodu resonness.

The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly polkilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents optimised P. salmonis OspA protein 17E2. The DNA encoding OspA 17E2 (AAR86247) has been optimised for expression in Ecsherichia coli. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antibody response.
                                                                                                                                                                                                                                 Poikilothermic fish; Piscirickettsia vaccine; OspA; salmonid rickettsial sSRS; 17E2; fusion construct.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an immunogenic amount of a P. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals, particularly poikilothermic fish, against the bacterial pathogen P. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents the amino acid sequence of C17E2, a P. salmonis OspA construct optimised for expression in Escherichia coli, fused to an undefined N-terminal fusion partner. The fusion protein is used in a

Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis

This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Piscirickettsia salmonis. The method comprises administering an Immunogenic amount of a particularly poikilothermic fish, against the salmonis specific antigen termed OspA, or an immunogenic fragment of particularly polkilothermic fish, against the bacterial pathogen animals, rickettsial septicaemia (SRS) and other ricketting against salmonid sequence represents an immunogenic epitope of the p. salmonis OspA protein. The peptide is used to raise rabbit anti-OspA antibodies.

The present sequence is that of BASB113 protein from Moraxella Catarrhalis strain Mc2931 (ATCC 43617), a Causative agent of otitis media in children and pneumonia in adults. The invention provides BASB113 polypeptides, and polynucleotides encoding them, as well as expression vectors, host cells and methods for producing BASB113 Composition comprising a BASB113 polypeptide, an immunogenic
                                                                                                     Claim 1; Page 67; 86pp;
                                                                                                       New BASB113 polypeptide isolated from Moraxella catarrhalis bacterium, useful for diagnosing and producing vaccines against bacterial infections such as otitis media and pneumonia.
                                                                                                                                                                           N-PSDB;

AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.

The invention

Claim 20; SEQ ID No 46265; 103pp; English.

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations biodiversity.

WO200153333-A1

```
CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC to restore normal activity of (II) or to treat disease states involving or imaging or sites expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or imaging of sites expressing (II). (II) and its binding partners are useful for restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful in tissue, as molecular weight markers and as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical consisting of sites expressing (II). (I) and (II) are useful for treating or disorders involving aberrant protein expression or biological activity. CC and to produce other types of data and products dependent on ECC and to produce other types of data and products dependent on DNA and CC specification, but was obtained in electronic format directly from WIPO CC at ftp. wipo.int/pub/published pot sequences of the invention.

                                                                CC Clavips) recombinant silk protein pETNCDS. The invention of the orb-weaver spider (Nephila CC clavips) recombinant silk protein pETNCDS. The invention of structural proteins. Organic acids are used to lyse recombinant CC cells or other biological samples (such as non-recombinant) of the structural proteins. Organic acids are used to lyse recombinant CC proteins by hydrolysing many of the macromolecules while leaving CC the structural proteins intact. In the case of silk proteins, the criminal proteins intact. In the case of silk proteins, the criminatography and processed into an aqueous-based mixture for into vector pET24 for recombinant expression in Escherichia coli, and recombinant silk protein was obtained using formic acid containing denaturant (3 M guanidine-HCl) and by affinity cometors of the invention can be used in the construction of many the invention can be used in the construction of many cometorials including films, fibres, woven articles, sutures, method has the following advantages over prior art: it involves can be steps, requires less time and smaller volumes of reagents,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 2; Page 41-42; 49pp; English.

                                                                                                                                                                capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                              The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                               Disclosure; SEQ ID NO 25488; 21pp + Sequence Listing;

                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signaling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmacceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            genes from Drosophila and interactions
                                                                                                                                                                                                                                                                                                                                                              The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2179
